NCI CGAP EII is a normalized cDNA library containing the
following tissue(s): Chondrosarcoma. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oligo-dT primer containing a
Not I Site. Double stranded cDNA was ligated to an ECOR I
adaptor, digested with Not I, and cloned directionally
into pT7T3-Pac vector. The oligonucleotide used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
(dT)18 tail. The sequence tag for this library is
                                                                                                                                                                                      TAG_LIB=UI-H-EI1

Site 2: NotI; The poly (A)+ RNA was decapped with tabacco
acid pyrophosphatase (TAP) and ligated with DNA-RNA linker
including EcoRI site by treatment of T4 RNA ligase. The
first strand cDNA was synthesized from oligo dT-selected
mRNA by priming with dT-tailed vector. The dT-tailed
vector was adjusted to have about 60nt. The cDNA vector
was circularized with E. coli DNA ligase after digestion
of EcoRI which site is also included in vector. An RNA
strand converted to a DNA strand by Okayama-Berg method.
The obtained cDNA vectors were used for transformation of
competent cells E. coli TOP10F' by electroporation of
colonies in original cDNA library, the abundant cDNAs were
selected and amplified by PCR reaction using vector region
primer including T7 promotor as 5' primer and N(dT)14 as
3' primer. The PCR products were used as template for
synthesis of biotinylated single stranded RNA by in vitro
transcription reaction. The synthesized RNA probes were
hybridized with antisense single stranded cDNAs prepared
from original liberary and incubated with avidin-gel.
After removing DNA-RNA hybrids by centringe, the
subtracted cDNA libraries were constructed by
transformation of the remaining DNA into competent cells E.
coli Top10F' with electroporation method."

These data suggest that aggregation of IL-IRI and IL-IRacP as a result of protein overexpression can elicit a signaling pathway leading to NF-kappaB activation. Modulating signal transduction involving NF-kappaB in a cell may be achieved by modulating the activity
                                                                                                                                                                                                                                    therapy, therapeutic In-leach nucleary across are availability of cellular expression or intracellular comprises a method of screening active IL-leach. This invention also comprises a method of screening an agent that modulates the interaction of an interleukin receptor accessory polypeptide (IL-leach) to a binding target.
                                                                                                                                                                                                                                                                                                        of II-lRacP using binding agents such as agonists and antagonists. Hybridisation probes to the cDNA sequence can be used to identify with type and mutant II-lRacP alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific oligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In therapy, therapeutic II-lRacP nucleic acids are used to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein (IL-1RacP) of the invention. The interleukin receptor accessory protein (IL-1RacP) and its modulators (agonists/antagonists)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; Fig 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cao

The invention particularly relates to nucleic acids, proteins and antibodies which regulate development and/or the immune system. The invention also relates to antibody fragments which specifically bind to antigenic fragments of a primate interleukin (IL)-1 receptor like molecules such as IL-1 receptor DNAX designation (IL-1RD). The antibody fragments of the invention are useful to treat conditions exhibiting abnormal expression of the receptors or their ligands which typically will be immunological disorders. The present sequence is human IL-1RD3

This sequence represents the human interleukin-1 receptor accessory comported (IL-1RacP) mutant delta Cl of the invention. This mutant Cl was used to define domains of the IL-1RacP protein that have the Ca ability to activate NF-kappaB expression. The interleukin receptor accessory protein (IL-1RacP) and its modulators (agonists/antagonists) Cl are useful for regulating cell function. Transient expression of either Cl IL-1RI or IL-1RAcP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 29 cells, however coexpression of NF-kappaB activity to a level comparable to that induced by IL-1. These data suggest that aggregation of IL-1RI and IL-1RacP a result of protein overexpression can elicit a signaling pathway cl leading to NF-kappaB activity to a level comparable to that induced by IL-1. These data suggest that aggregation of IL-1RI and IL-1RacP as a result of protein overexpression can elicit a signaling pathway cl leading to NF-kappaB activation. Modulating signal transduction involving NF-kappaB in a cell may be achieved by modulating the activity of IL-1RacP using binding agents such as agonists and antagonists. Cl for IL-1RacP using binding agents such as agonists and antagonists. Cl involving NF-kappaB in a cell may be achieved by modulatify wild-type and mutant IL-1RAcP alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific cligonuclectide (ASO) probes for high-throughput clinical diagnoses of therapy, therapeutic IL-1RacP nucleic acids are used to modulate callular expression or intracellular concentration or availability of active IL-1RacP. This invention also comprises a method of screening for an agent that modulates the interaction of an interleukin receptor accessory polypeptide (IL-1RacP) to a binding target.

It can be obtd. in pure, recombinant form using a cDNA clone (AAT32026) obtd. from YT cells. A soluble form (AAW01912) of human IL-IR ACP has also been produced. The protein is partic. useful in preventing the inflammatory or immunological activities of IL-1, esp. for the treatment of rheumatoid arthritis, inflammatory bowel disease, septic shock, transplant rejection, psoriasis, asthma, type 1 diabetes or acute and chronic myelogenous leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   was used to define domains of the II-lRacP protein that have the Cability to activate NF-kappaB expression. The interleukin receptor accessory protein (II-lRacP) and its modulators (agonists/antagonists) are useful for regulating cell function. Transient expression of either II-lRacP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in activation of NF-kappaB activity to a level comparable to that induced by II-1. These data suggest that aggregation of II-lRacP as a result of protein overexpression can elicit a signal uransduction involving NF-kappaB activation. Modulating signal transduction involving NF-kappaB activation. Modulating signal transduction involving NF-kappaB activation. Modulating signal transduction of II-lRacP using binding agents such as agonists and antagonists. Hybridisation probes to the cDNA sequence can be used to identify wild-type and mutant II-lRacP alleles in clinical and laboratory camples. Mutant alleles are used to generate allela-specific coligonucleotide (ASO) probes for high-throughput clinical diagnoses of the coll as a contagent or modulation.
                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              therapy, therapeutic II-IRacP nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active II-IRacP. This invention also comprises a method of screening an agent that modulates the interaction of an interleukin receptor accessory polypeptide (II-1RacP) to a binding target.

This sequence represents the human interleukin-1 receptor accessory protein (IL-IRacP) mutant delta C3 of the invention. This mutant was used to define domains of the IL-IRacP protein that have the ability to activate NF-kappaB expression. The interleukin receptor accessory protein (IL-IRacP) and its modulators (agonists/antagonists) are useful for regulating cell function. Transient expression of either IL-IRI of IL-IRacP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in activation of NF-kappaB activity to a level comparable to that induced by IL-1. These data suggest that aggregation of IU-IRI and IL-IRacP as
                                                                                                                                                                                                                                       Isolated polypeptide designated interleukin receptor accessory polypeptide is useful for regulating cell function
                                                                                                                                                                                                                                                                                          WPI; 2001-595441/67.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In therapy, therapeutic IL-lacep nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active IL-lacep. This invention also comprises a method of screening is an agent that modulates the interaction of an interleukin receptor accessory polypeptide (IL-lacep) to a binding target. Note: The present sequence is not included in the specification but was created from the human IL-la RcP sequence appearing as AAU09366 and theinformation given in table 1 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 involving NF-kappaB in a cell may be achieved by modulating the activity of IL-IRacP using binding agents such as agonists and antagonists. Hybridisation probes to the cDNA sequence can be used to identify wild-type and mutant IL-IRAcP alleles in clinical and laboratory type and mutant alleles are used to generate allele-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a result of protein overexpression can elicit a signaling leading to NP-kappaB activation.                                                                                                                                                                                                                                                                                                                                                                                       ct accessory protein (11-18acF) and the modulators (agonists) and operation. CC are useful for regulating ceall function, Transient expression of either CC IL-1RI or IL-1RAcP alone does not result in ligand-independent induction CC of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however CC coexpression of both proteins resulted in a 20-fold increase in CC attivation of NF-kappaB activity to a level comparable to that induced CC by IL-1. These data suggest that aggregation of IL-1RI and IL-1RacP as CC a result of protein overexpression can elicit a signaling pathway CC leading to NF-kappaB activation. Modulating signal transduction CC involving NF-kappaB in a cell may be achieved by modulating the activity CC of IL-1RacP using binding agents such as agonists and antagonists. CC type and mutant IL-1RAcP alleles in clinical and laboratory type and mutant IL-1RAcP alleles in clinical and laboratory colligonucleotide (AsO) probes for high-throughput clinical diagnoses CC of diseases or disorders with an inflammatory response. In C therapy, therapeutic IL-1RacP nucleic acids are used to modulate C cellular expression or intracellular concentration or availability of active IL-1RacP. This invention also comprises a method of screening for C accessory polypeptide (IL-1RacP) to a binding target. CC specification but was created from the human IL-1R AcP sequence can agpent that modulates is not included in the specific and theinformation given in table 1 of the comparisor as ANU09966 and theinformation given in table 1 of the

           protein at tyrosine 503. The interleukin receptor accessory protein (IL-IRacP) and its modulators (agonists/antagonists) are useful for regulating cell function. Transient expression of either IL-IRI or IL-IRAcP alone does not result in ligand-independent induction of an NP-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in
                                                                               This sequence represents the human interleukin-1 receptor accessory protein (IL-1RacP) mutant delta C2 #2 of the invention. This deletimutant was used to define a phosphorylated domain of the IL-1RacP protein at tyrosine 503. The interleukin receptor accessory protein
                                                                                                                                                                              Isolated polypeptide designated interleukin receptor accessory
polypeptide is useful for regulating cell function -

These data suggest that aggregation. These data suggest that aggregation. The second of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         samples. Mutant alleles are used to generate allele-specific oligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In therapy, therapeutic II-IRacP nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active II-IRacP. This invention also comprises a method of screening an agent that modulates the interaction of an interleukin receptor accessory polypeptide (II-IRacP) to a binding target. Note: The present sequence is not included in the specification but was created from the human II-IR AcP sequence appearing as AAU09966 and theinformation given in table 1 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                             SXG
                                                                                                                                                                                                                                                                                                                                                       cc ability to activate NF-kappaB expression. The interleukin receptor cc ability to activate NF-kappaB expression. Transient expression of either care useful for regulating cell function. Transient expression of either cc are useful for regulating cell function. Transient expression of either cc II-IRI or II-IRACP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of NF-kappaB extivity to a level comparable to that induced by II-1. These data suggest that aggregation of II-IRI and II-IRACP as a result of protein overexpression can elicit a signaling pathway cc leading to NF-kappaB activation. Modulating signal transduction cr involving NF-kappaB activation. Modulating signal transduction cr involving NF-kappaB in a cell may be achieved by modulating the activity of II-IRACP using binding agents such as agonists and antagonists. Cc Hybridisation probes to the cDNA sequence can be used to identify wild-type and mutant II-IRACP alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific coligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In therapy, therapeutic II-IRACP nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active II-IRACP. This invention also comprises a method of screening for cative II-IRACP. This invention also comprises a method of screening for an agent that modulates the interaction of an interleukin receptor specification but was created from the human II-IR AcP sequence specification.
                                                                                                                                                                                                                                                                                                                                                                                                                               Հନନନନନନନନନନନନନନନନନନନନନନନ

Its amino acid sequence was deduced from a cDNA clone (AAT32028) derived from 3R3-L1 cells. A human homologue (AAW01911) of the IL-IR AcP has been isolated that is useful in modulating the inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC protein (II-IR AcP), the cDNA sequence for this protein was used to generate a hybridisation probe that was used to isolate the human CC II-IR AcP cDNA sequence of the invention. The interleukin-1 receptor CC accessory protein (II-IR AcP) and its modulators (agonists/antagonists) are useful for regulating cell function. Transient expression of either CI II-IR or II-IR AcP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in CC activation of NF-kappaB activity to a level comparable to that induced by II-1. These data suggest that aggregation of II-IRI and II-I RACP as a result of protein overexpression can elicit a signaling pathway CC leading to NF-kappaB activation. Modulating signal transduction CC involving NF-kappaB in a cell may be achieved by modulating the activity of II-IRACP using binding agents such as agonists and antagonists. CC Hybridisation probes to the cDNA sequence can be used to identify wild-type and mutant II-IR AcP alleles in clinical and laboratory CC samples. Mutant alleles are used to generate allele-specific CC digonucleotide (ASO) probes for high-throughput clinical diagnoses CC of diseases or disorders with an inflammatory response. In CC cellular expression or intracellular concentration or availability of CC active II-IR ACP. This invention also comprises a method of screening for an agent that modulates the interaction of an interleukin receptor CC accessory polypeptide (II-IRACP) to a binding target.

The present invention relates to compositions and methods for affect: mammalian physiology such as morphogenesis of immune system function. The invention particularly relates to nucleic acids, proteins and antibodies which regulate development and/or the immune system. The invention also relates to antibody fragments which specifically bind to antigenic fragments of a primate interleukin (IL)-1 receptor like
                                                                                        Antibody fragments which specifically bind to primate interleukin receptor-like molecules are useful to treat conditions associated abnormal expression of the receptor or its ligand, particularly immunological disorders
                                                                                                                                                                                                                                                                                                                                                                            Key

The antibout fragments of the invention are useful to treat conditions exhibiting abnormal expression of the receptors or their ligands which typically be immunological disorders. The present sequence is mouse IL-1RD will be immunological disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              accessory protein (II-IRacP) and its modulators (agonists) are useful for regulating cell function. Transient expression of either II-IRI or II-IRAcP alone does not result in ligand-independent induction of an NW-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in activation of NW-kappaB activity to a level comparable to that induced by II-1. These data suggest that aggregation of II-IRI and II-IRacP as a result of protein overexpression can elicit a signaling pathway leading to NW-kappaB activation. Modulating signal transduction involving NW-kappaB in a cell may be achieved by modulating the activity of II-IRacP using binding agents such as agonists and antagonists. Hybridisation probes to the cDNA sequence can be used to identify wild-type and mutant II-IRACP alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific oligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In therapy, therapeutic II-IRACP nucleic acids are used to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         B
CC (II-IRACP) and its modulators (agonists/antagonists) are useful
CC (II-IRACP) and its modulators (agonists/antagonists) are useful
CC or II-IRACP alone does not result in ligand-independent induction
CC of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however
CC coexpression of both proteins resulted in a 20-fold increase in
CC activation of NF-kappaB activity to a level comparable to that induced
CC by II-1. These data suggest that aggregation of II-IRI and II-IRacP as
CC a result of protein overexpression can elicit a signaling pathway
CC involving NF-kappaB in a cell may be achieved by modulating the activity
CC involving NF-kappaB in a cell may be achieved by modulating the activity
CC if II-IRacP using binding agents such as agonists and antagonists.
CC type and mutant II-IRACP alleles in clinical and laboratory
CC samples. Mutant alleles are used to generate allele-specific
CC oligonucleotide (ASO) probes for high-throughput clinical diagnoses
CC of diseases or disorders with an inflammatory response. In
CC cellular expression or intracellular concentration or availability of
CC active II-IRacP. This invention also comprises a method of screening for
                                                                                                                                                                                                                                                                                                                                                    This sequence represents the human interleukin-1 receptor accessory protein (IL-1RacP) mutant delta N1 #2 of the invention. This deletic mutant was used to define a phosphorylated domain of the IL-1RacP protein at tyrosine 503. The interleukin receptor accessory protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated polypeptide designated interleukin receptor accessory polypeptide is useful for regulating cell function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human IL-1R AcP protein deletion mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-MAY-2002
